

## SLP model B

### Platform lift that blends neatly into its surroundings

The Stepless SLP B platform lift is a bespoke model, where both the platform itself and the tall safety barrier are built into a prefabricated pit in the ground, making it almost impossible to spot when not in use. It can be finished with almost any surface – cobblestones, tiles or paving stones, for example – to ensure it merges discreetly with its setting.

When the SLP B is activated, the safety barriers rise up automatically to prevent users rolling off the edge while the platform is in motion.

Designed for outdoor use, the Stepless SLP platform lift is typically installed outside old, public and/or heritage buildings.

The SLP B model is designed for operation by users themselves, without external assistance. The platform can, however, also be operated via an external panel.
